

AI Agents for DevOps

AI Agent

Vs

AI Assistant (chat gpt)

Ex: (Bolt. new)

- Can do tasks

- Conversational

- we can't do the complete task like building a webApp we need to break the request and join them.

→ We can build our own AI Agent with the help of frameworks like

- Autogen
- langgraph
- Crew AI

Crew AI → Agent → LLM.

Example Agent that we will build:

Agent to Research
kubernetes → Crew AI
and give as blog.

Agent → Researcher
Agent → Summarise

Procedure:

1. Check the python version.

2. Create virtual environment.

`python3 -m venv "env: env name"`

3. Go to virtual

source `env/bin/activate`.

4. `pip3 install crewAI`

5. `crewai create devops-ai-project`.

This will generate a direct working model agent to do the research on particular topic.

~ This was the default thing generated by it.

Thank You!
